Changing the default text output font in SPSS v29

With the release of SPSS v29, IBM changed the default output font for text output such as generated by PROCESS. The new default font will produce sloppy-looking output, with information not properly formatted and spaced. To return the format of the output to pre-v29 form, follow the directions below.

Under the “Edit” menu in SPSS, Choose “Options”. The window below will open. Change the font under “Text Output” to “Courier New” and click the “Apply” button and then “OK” at the bottom of the window.

This modification only needs to be completed once. After this change, PROCESS output will be properly formatted every time you open SPSS and use PROCESS.
